

Bench vice made of cast iron/steel and it is used to hold or clamp work for filing, planing, threading. The size of the vice is stated by the width of the jaws.

Machine vice: Mechanical device designed to hold workpiece still during machine operations. It is hardened by steel jaws.

Wooden Vice: Attached to wooden bench. These jaws are made of wood or metal. Used to hold workpiece.

Surface Plate: It is a solid plate and as a horizontal surface reference plane for precision inspection marking & tool setup. It is often used as the baseline for all the measurements to the work piece.

Steel Rule: used for making measurements/dimensions on the wood & the marking gauge. made of steel. graduated on both sides of mm, cm, inch.

Q/A

Q. What is state the differences between

a) Mallet and Hammer

Mallets have wooden or steel handle. They have wide head made up of wood and are used to drive pins, flatten surfaces. Hammers have their head made up of metal used to drive nails, screws etc.

b) Chisel and Gauge

Chisel is a tool used for generally chiselling/cutting wood while a gauge is used for cutting & making curved surfaces.

c) Rip saw & Tenon Saw

Rip saw is used for cutting smaller/medium sized work.

Tenon saw is used to cut joints & fine work. A tenon saw has
