

more no. of teeth per unit length as compared to a rip saw

c) Describe the function of Try Square?

Try Square is used for measuring & marking process. It consist of steel blade fitted in a wooden or metal stock at right angle. The steel blade being graduated in mm/inches. It is used to make measure plane surface, to measure adjacent surface perpendicular.

c) Describe the types of saw and their applications?

Rip Saw: It is used for cutting wood. It is either straight or skew backed. Fitted in a wooden handle. Correct angle for rip sawing is 60° . It is 100 mm long and has 3 to 5 teeth per 25 mm.

Cross-cut saw: Also called 'hand saw'. Sawing cutting at 90° to the grain is called cross-cutting. The correct angle of cross cutting is 45° . It is 600 mm with 6-8 teeth per 25 mm.

Tenon Back saw: Used for fine and accurate work. It consists of very fine blade, reinforced with a rigid steel back. Its length varies from 350 mm to 400 mm and 10 to 12 teeth.

Dovetail Saw: Similar to tenon but smaller in size to tenon saw. 12 to 13 teeth per 25 mm. Used for carpentering works such as dovetail joints.

d) mention types of Chisels and their use.

Flower Chisel: Used by hand pressure or with a mallet for cutting square recess in wooden pieces. Has a flat blade of 5-25 mm width and 125 mm length. End of blade is
