

Q) What is the function of flux on welding?

In welding, flux protects the molten weldpool from atmospheric gases like O_2 , N_2 etc to prevent porosity and brittleness in the weld; it also cleans the metal surface of impurities and oxides, enhancing weld strength.

Q) What do you understand by welding position?

The welding position refers to the orientation of the workpiece and the direction of the weld joint relative to welder and gravity.

Q) Describe how is arc initially generated?

To initiate the arc, the welder has to briefly touch the tip of the electrode to the workpiece to complete the circuit then the electrode is slightly moved from the workpiece to initiate the arc.

Q) Why edge preparation is done before making joints by welding?

Preparation before welding is essential to ensure proper fit-up, full penetration, remove contamination. Contaminants improve weld strength and enhance weld appearance.
