

Q) What type of gases are used on gas welding?

The types of gases used on gas welding are:-

→ O_2 and $HC=CH$

→ O_2 and H_2

→ O_2 and natural gas

Q) What is the right hand and left hand welding in gas welding?

In left hand welding:-

Root proceeds the nozzle tip on the direction in which weld is being made and tip is also pointing on same direction

In right hand welding:-

the nozzle tip precedes the rod on direction of the travel and is pointed back at the motion puddle and complete the weld

Q) What is the colour code for different gas cylinder?

The oxygen containing cylinder is black or blue where as fuel gas containing is maroon or red in color

Q) Describe working principle of gas welding

Gas welding is fusion welding process in which the heat source is flame, produced by combustion of fuel gas and O_2 . The flame temperature is around $32000^\circ C$ to melt the edges of surfaces to be joined.
